</table>
Abdominal Pain

1. Given a patient with abdominal pain, paying particular attention to its location and chronicity:
   a) Distinguish between acute and chronic pain.
   b) Generate a complete differential diagnosis (ddx).
   c) Investigate in an appropriate and timely fashion.

2. In a patient with diagnosed abdominal pain (e.g., gastroesophageal reflux disease, peptic ulcer disease, ulcerative colitis, Crohn’s disease), manage specific pathology appropriately (e.g., with medication, lifestyle modifications).

3. In a woman with abdominal pain:
   a) Always rule out pregnancy if she is of reproductive age.
   b) Suspect gynecologic etiology for abdominal pain.
   c) Do a pelvic examination, if appropriate.

4. In a patient with acute abdominal pain, differentiate between a surgical and a non-surgical abdomen.

5. In specific patient groups (e.g., children, pregnant women, the elderly), include group-specific surgical causes of acute abdominal pain in the ddx.

6. Given a patient with a life-threatening cause of acute abdominal pain (e.g., a ruptured abdominal aortic aneurysm or a ruptured ectopic pregnancy):
   a) Recognize the life-threatening situation.
   b) Make the diagnosis.
   c) Stabilize the patient.
   d) Promptly refer the patient for definitive treatment.

7. In a patient with chronic or recurrent abdominal pain:
   a) Ensure adequate follow-up to monitor new or changing symptoms or signs.
   b) Manage symptomatically with medication and lifestyle modification (e.g., for irritable bowel syndrome).
   c) Always consider cancer in a patient at risk.

8. Given a patient with a diagnosis of inflammatory bowel disease (IBD) recognize an extra intestinal manifestation.
Advanced Cardiac Life Support

1. Keep up to date with advanced cardiac life support (ACLS) recommendations (i.e., maintain your knowledge base).

2. Promptly defibrillate a patient with ventricular fibrillation (V fib), or pulseless or symptomatic ventricular tachycardia (V tach).

3. Diagnose serious arrhythmias (V tach, V fib, supraventricular tachycardia, atrial fibrillation, or second- or third-degree heart block), and treat according to ACLS protocols.

4. Suspect and promptly treat reversible causes of arrhythmias (e.g., hyperkalemia, digoxin toxicity, cocaine intoxication) before confirmation of the diagnosis.

5. Ensure adequate ventilation (i.e., with a bag valve mask), and secure the airway in a timely manner.

6. In patients requiring resuscitation, assess their circumstances (e.g., asystole, long code times, poor pre-code prognosis, living wills) to help you decide when to stop. (Avoid inappropriate resuscitation.)

7. In patients with serious medical problems or end-stage disease, discuss code status and end-of-life decisions (e.g., resuscitation, feeding tubes, levels of treatment), and readdress these issues periodically.

8. Attend to family members (e.g., with counselling, presence in the code room) during and after resuscitating a patient.

9. In a pediatric resuscitation, use appropriate resources (e.g., Braeslow tape, the patient’s weight) to determine the correct drug doses and tube sizes.

Note: Shock is not dealt with in this topic.
Allergy

1 In all patients, always inquire about any allergy and clearly document it in the chart. Re-evaluate this periodically.

2 Clarify the manifestations of a reaction in order to try to diagnose a true allergic reaction (e.g., do not misdiagnose viral rashes as antibiotic allergy, or medication intolerance as true allergy).

3 In a patient reporting allergy (e.g., to food, to medications, environmental), ensure that the patient has the appropriate medication to control symptoms (e.g., antihistamines, bronchodilators, steroids, an EpiPen).

4 Prescribe an EpiPen to every patient who has a history of, or is at risk for, anaphylaxis.

5 Educate appropriate patients with allergy (e.g., to food, medications, insect stings) and their families about the symptoms of anaphylaxis and the self-administration of the EpiPen, and advise them to return for immediate reassessment and treatment if those symptoms develop or if the EpiPen has been used.

6 Advise patients with any known drug allergy or previous major allergic reaction to get a MedicAlert bracelet.

7 In a patient presenting with an anaphylactic reaction:
   a) Recognize the symptoms and signs.
   b) Treat immediately and aggressively.
   c) Prevent a delayed hypersensitivity reaction through observation and adequate treatment (e.g., with steroids).

8 In patients with anaphylaxis of unclear etiology refer to an allergist for clarification of the cause.

9 In the particular case of a child with an anaphylactic reaction to food:
   a) Prescribe an EpiPen for the house, car, school, and daycare.
   b) Advise the family to educate the child, teachers, and caretakers about signs and symptoms of anaphylaxis, and about when and how to use the EpiPen.

10 In a patient with unexplained recurrent respiratory symptoms, include allergy (e.g., sick building syndrome, seasonal allergy) in the differential diagnosis.
Anemia

1. Assess the risk of decompensation of anemic patients (e.g., volume status, the presence of congestive heart failure [CHF], angina, or other disease states) to decide if prompt transfusion or volume replacement is necessary.

2. In a patient with anemia, classify the anemia as microcytic, normocytic, or macrocytic by using the MCV (mean corpuscular value) or smear test result, to direct further assessment and treatment.

3. In all patients with anemia, determine the iron status before initiating treatment.

4. In a patient with iron deficiency, investigate further to find the cause.

5. Consider and look for anemia in appropriate patients (e.g., those at risk for blood loss [those receiving anticoagulation, elderly patients taking a nonsteroidal anti-inflammatory drug]) or in patients with hemolysis (mechanical valves), whether they are symptomatic or not, and in those with new or worsening symptoms of angina or CHF.

6. In patients with macrocytic anemia:
   a) Consider the possibility of vitamin B\textsubscript{12} deficiency.
   b) Look for other manifestations of the deficiency (e.g., neurologic symptoms) in order to make the diagnosis of pernicious anemia when it is present.

7. As part of well-baby care, consider anemia in high-risk populations (e.g., those living in poverty) or in high-risk patients (e.g., those who are pale or have a low-iron diet or poor weight gain).

8. When a patient is discovered to have a slightly low hemoglobin level, look carefully for a cause (e.g., hemoglobinopathies, menorrhagia, occult bleeding, previously undiagnosed chronic disease), as one cannot assume that this is normal for them.

9. In anemic patients with menorrhagia, determine the need to look for other causes of the anemia.
Antibiotics

1 In patients requiring antibiotic therapy, make rational choices (i.e., first-line therapies, knowledge of local resistance patterns, patient's medical and drug history, patient's context).

2 In patients with a clinical presentation suggestive of a viral infection, avoid prescribing antibiotics.

3 In a patient with a purported antibiotic allergy, rule out other causes (e.g., intolerance to side effects, non-allergic rash) before accepting the diagnosis.

4 Use a selective approach in ordering cultures before initiating antibiotic therapy (usually not in uncomplicated cellulitis, pneumonia, urinary tract infections, and abscesses; usually for assessing community resistance patterns, in patients with systemic symptoms, and in immunocompromised patients).

5 In urgent situations (e.g., cases of meningitis, septic shock, febrile neutropenia), do not delay administration of antibiotic therapy (i.e., do not wait for confirmation of the diagnosis).
Anxiety

1. Do not attribute acute symptoms of panic (e.g., shortness of breath, palpitations, hyperventilation) to anxiety without first excluding serious medical pathology (e.g., pulmonary embolism, myocardial infarction) from the differential diagnosis (especially in patients with established anxiety disorder).

2. When working up a patient with symptoms of anxiety, and before making the diagnosis of an anxiety disorder:
   a) Exclude serious medical pathology.
   b) Identify:
      - other co-morbid psychiatric conditions.
      - abuse.
      - substance abuse.
   c) Assess the risk of suicide.

3. In patients with known anxiety disorders, do not assume all new symptoms are attributable to the anxiety disorder.

4. Offer appropriate treatment for anxiety:
   - benzodiazepines (e.g., deal with fear of them, avoid doses that are too low or too high, consider dependence, other anxiolytics).
   - non-pharmacologic treatment.

5. In a patient with symptoms of anxiety, take and interpret an appropriate history to differentiate clearly between agoraphobia, social phobia, generalized anxiety disorder, and panic disorder.
Asthma

1. In patients of all ages with respiratory symptoms (acute, chronic, recurrent):
   a) Include asthma in the differential diagnosis.
   b) Confirm the diagnosis of asthma by appropriate use of:
      - history.
      - physical examination.
      - spirometry.

2. In a child with acute respiratory distress, distinguish asthma or bronchiolitis from croup and foreign body aspiration by taking an appropriate history and doing a physical examination.

3. In a known asthmatic, presenting either because of an acute exacerbation or for ongoing care, objectively determine the severity of the condition (e.g., with history, including the pattern of medication use), physical examination, spirometry). Do not underestimate severity.

4. In a known asthmatic with an acute exacerbation:
   a) Treat the acute episode (e.g., use beta-agonists repeatedly and early steroids, and avoid under-treatment).
   b) Rule out co-morbid disease (e.g., complications, congestive heart failure, chronic obstructive pulmonary disease).
   c) Determine the need for hospitalization or discharge (basing the decision on the risk of recurrence or complications, and on the patient’s expectations and resources).

5. For the ongoing (chronic) treatment of an asthmatic, propose a stepwise management plan including:
   - self-monitoring.
   - self-adjustment of medication.
   - when to consult back.

6. For a known asthmatic patient, who has ongoing or recurrent symptoms:
   a) Assess severity and compliance with medication regimens.
   b) Recommend lifestyle adjustments (e.g., avoiding irritants, triggers) that may result in less recurrence and better control.
Atrial Fibrillation

1 In a patient who presents with new onset atrial fibrillation, look for an underlying cause (e.g., ischemic heart disease, acute myocardial infarction, congestive heart failure, cardiomyopathy, pulmonary embolus, hyperthyroidism, alcohol, etc.)

2 In a patient presenting with atrial fibrillation,
   a) Look for hemodynamic instability,
   b) Intervene rapidly and appropriately to stabilize the patient.

3 In an individual presenting with chronic or paroxysmal atrial fibrillation,
   a) Explore the need for anticoagulation based on the risk of stroke with the patient,
   b) Periodically reassess the need for anticoagulation.

4 In patients with atrial fibrillation, when the decision has been made to use anticoagulation, institute the appropriate therapy and patient education, with a comprehensive follow-up plan.

5 In a stable patient with atrial fibrillation, identify the need for rate control.

6 In a stable patient with atrial fibrillation, arrange for rhythm correction when appropriate.
Bad News

1 When giving bad news, ensure that the setting is appropriate, and ensure patient’s confidentiality.

2 Give bad news:
   - in an empathic, compassionate manner
   - allowing enough time.
   - providing translation, as necessary.

3 Obtain patient consent before involving the family.

4 After giving bad news, arrange definitive follow-up opportunities to assess impact and understanding.
1 Because behavioural problems in children are often multifactorial, maintain a broad differential diagnosis and assess all factors when concern has been raised about a child’s behaviour:
   - look for medical conditions (e.g., hearing impairment, depression, other psychiatric diagnoses, other medical problems).
   - look for psychosocial factors (e.g., abuse, substance use, family chaos, peer issues, parental expectations).
   - recognize when the cause is not attention deficit disorder (ADD) (e.g., learning disorders, autism spectrum disorder, conduct disorder).

2 When obtaining a history about behavioural problems in a child:
   - ask the child about her or his perception of the situation.
   - use multiple sources of information (e.g., school, daycare).

3 When treating behavioural problems in children for whom medication is indicated, do not limit treatment to medication; address other dimensions (e.g., do not just use amphetamines to treat ADD, but add social skills teaching, time management, etc.).

4 In assessing behavioural problems in adolescents, use a systematic, structured approach to make an appropriate diagnosis:
   - specifically look for substance abuse, peer issues, and other stressors.
   - look for medical problems (bipolar disorder, schizophrenia).
   - do not say the problem is “just adolescence.”

5 In elderly patients known to have dementia, do not attribute behavioural problems to dementia without assessing for other possible factors (e.g., medication side effects or interactions, treatable medical conditions such as sepsis or depression).
Breast Lump

1  Given a well woman with concerns about breast disease, during a clinical encounter (annual or not):
   a) Identify high-risk patients by assessing modifiable and non-modifiable risk factors
   b) Advise regarding screening (mammography, breast self-examination) and its limitations.
   c) Advise concerning the woman’s role in preventing or detecting breast disease (breast self-examination, lifestyle changes).

2  Given a woman presenting with a breast lump (i.e., clinical features):
   a) Use the history, features of the lump, and the patient’s age to determine (interpret) if aggressive work-up or watchful waiting is indicated.
   b) Ensure adequate support throughout investigation of the breast lump by availability of a contact resource.
   c) Use diagnostic tools (e.g., needle aspiration, imaging, core biopsy, referral) in an appropriate manner (i.e., avoid over- or under-investigation, misuse) for managing the breast lump.

3  In a woman who presents with a malignant breast lump and knows the diagnosis:
   a) Recognize and manage immediate and long-term complications of breast cancer.
   b) Consider and diagnose metastatic disease in the follow-up care of a breast cancer patient by appropriate history and investigation.
   c) Appropriately direct (provide a link to) the patient to community resources able to provide adequate support (psychosocial support).
Cancer

1. In all patients, be opportunistic in giving cancer prevention advice (e.g., stop smoking, reduce unprotected sexual intercourse, prevent human papillomavirus infection), even when it is not the primary reason for the encounter.

2. In all patients, provide the indicated evidence-based screening (according to age group, risk factors, etc.) to detect cancer at an early stage (e.g., with Pap tests, mammography, colonoscopy, digital rectal examinations, prostate-specific antigen testing).

3. In patients diagnosed with cancer, offer ongoing follow-up and support and remain involved in the treatment plan, in collaboration with the specialist cancer treatment system. (Don't lose track of your patient during cancer care.)

4. In a patient diagnosed with cancer, actively inquire, with compassion and empathy, about the personal and social consequences of the illness (e.g., family issues, loss of job), and the patient's ability to cope with these consequences.

5. In a patient treated for cancer, actively inquire about side effects or expected complications of treatment (e.g., diarrhea, feet paresthesias), as the patient may not volunteer this information.

6. In patients with a distant history of cancer who present with new symptoms (e.g., shortness of breath, neurologic symptoms), include recurrence or metastatic disease in the differential diagnosis.

7. In a patient diagnosed with cancer, be realistic and honest when discussing prognosis. (Say when you don't know.)

Note: For pain control, see the key features on chronic disease and palliative care. See also the key feature on depression.
Chest Pain

1. Given a patient with undefined chest pain, take an adequate history to make a specific diagnosis (e.g., determine risk factors, whether the pain is pleuritic or sharp, pressure, etc.).

2. Given a clinical scenario suggestive of life-threatening conditions (e.g., pulmonary embolism, tamponade, dissection, pneumothorax), begin timely treatment (before the diagnosis is confirmed, while doing an appropriate work-up).

3. Rule out ischemic heart disease.*

4. Given an appropriate history of chest pain suggestive of herpes zoster infection, hiatal hernia, reflux, esophageal spasm, infections, or peptic ulcer disease:
   a) Propose the diagnosis.
   b) Do an appropriate work-up/follow-up to confirm the suspected diagnosis.

5. Given a suspected diagnosis of pulmonary embolism:
   a) Do not rule out the diagnosis solely on the basis of a test with low sensitivity and specificity.
   b) Begin appropriate treatment immediately.

Note: *See the key features on ischemic heart disease.
Chronic Disease

1 In a patient with a diagnosed chronic disease who presents with acute symptoms, diagnose:
   - acute complications of the chronic disease (e.g., diabetic ketoacidosis).
   - acute exacerbations of the disease (e.g., asthma exacerbation, acute arthritis).
   - a new, unrelated condition.

2 Regularly reassess adherence (compliance) to the treatment plan (including medications).

3 In patients with chronic disease:
   a) Actively inquire about pain.
   b) Treat appropriately by:
      - titrating medication to the patient’s pain.
      - taking into account other treatments and conditions (e.g., watching for interactions).
      - considering non-pharmacologic treatment and adjuvant therapies.

4 In patients with chronic disease, actively inquire about:
   - the psychological impact of diagnosis and treatment.
   - functional impairment.
   - underlying depression or risk of suicide.
   - underlying substance abuse.

5 Given a non-compliant patient, explore the reasons why, with a view to improving future adherence to the treatment plan.
Chronic Obstructive Pulmonary Disease

1 In all patients presenting with symptoms of prolonged or recurrent cough, dyspnea, or decreased exercise tolerance, especially those who also have a significant smoking history, suspect the diagnosis of chronic obstructive pulmonary disease (COPD).

2 When the diagnosis of COPD is suspected, seek confirmation with pulmonary function studies (e.g., FEV1).

3 In patients with COPD, use pulmonary function tests periodically to document disease progression.

4 Encourage smoking cessation in all patients diagnosed with COPD. *

5 Offer appropriate vaccinations to patients diagnosed with COPD (e.g., influenza/pneumococcal vaccination).

6 In an apparently stable patient with COPD, offer appropriate inhaled medication for treatment (e.g., anticholinergics/bronchodilators if condition is reversible, steroid trial).

7 Refer appropriate patients with COPD to other health professionals (e.g., a respiratory technician or pulmonary rehabilitation personnel) to enhance quality of life.

8 When treating patients with acute exacerbations of COPD, rule out co-morbidities (e.g., myocardial infarction, congestive heart failure, systemic infections, anemia).

9 In patients with end-stage COPD, especially those who are currently stable, discuss, document, and periodically re-evaluate wishes about aggressive treatment interventions.

Note: *See the key features on Smoking Cessation.
Contraception

1 With all patients, especially adolescents, young men, postpartum women, and perimenopausal women, advise about adequate contraception when opportunities arise.

2 In patients using specific contraceptives, advise of specific factors that may reduce efficacy (e.g., delayed initiation of method, illness, medications, specific lubricants).

3 In aiding decision-making to ensure adequate contraception:
   a) Look for and identify risks (relative and absolute contraindications).
   b) Assess (look for) sexually transmitted infection exposure.
   c) Identify barriers to specific methods (e.g., cost, cultural concerns).
   d) Advise of efficacy and side effects, especially short-term side effects that may result in discontinuation.

4 In patients using hormonal contraceptives, manage side effects appropriately (i.e., recommend an appropriate length of trial, discuss estrogens in medroxyprogesterone acetate [Depo-Provera]).

5 In all patients, especially those using barrier methods or when efficacy of hormonal methods is decreased, advise about post-coital contraception.

6 In a patient who has had unprotected sex or a failure of the chosen contraceptive method, inform about time limits in post-coital contraception (emergency contraceptive pill, intrauterine device).
Cough

1 In patients presenting with an acute cough:
   a) Include serious causes (e.g., pneumothorax, pulmonary embolism [PE]) in the differential diagnosis.
   b) Diagnose a viral infection clinically, principally by taking an appropriate history.
   c) Do not treat viral infections with antibiotics. (Consider antiviral therapy if appropriate.)

2 In pediatric patients with a persistent (or recurrent) cough, generate a broad differential diagnosis (e.g., gastroesophageal reflux disease [GERD], asthma, rhinitis, presence of a foreign body, pertussis).

3 In patients with a persistent (e.g., for weeks) cough:
   a) Consider non-pulmonary causes (e.g., GERD, congestive heart failure, rhinitis), as well as other serious causes (e.g., cancer, PE) in the differential diagnosis. (Do not assume that the child has viral bronchitis).
   b) Investigate appropriately.

4 Do not ascribe a persistent cough to an adverse drug effect (e.g., from an angiotensin-converting enzyme inhibitor) without first considering other causes.

5 In smokers with persistent cough, assess for chronic bronchitis (chronic obstructive pulmonary disease) and make a positive diagnosis when it is present. (Do not just diagnose a smoker’s cough.)
Counselling

1 In patients with mental health concerns, explore the role of counselling in treating their problems. (Intervention is not just about medication use.)

2 When making the decision about whether to offer or refer a patient for counselling:
   a) Allow adequate time to assess the patient.
   b) Identify the patient’s context and understanding of her or his problem/situation.
   c) Evaluate your own skills. (Does the problem exceed the limits of your abilities?)
   d) Recognize when your beliefs may interfere with counselling.

3 When counselling a patient, allow adequate time.

4 When counselling a patient, recognize when you are approaching or exceeding boundaries (e.g., transference, counter-transference) or limits (the problem is more complex than you originally thought), as this should prompt you to re-evaluate your role.
Crisis

1. Take the necessary time to assist patients in crisis, as they often present unexpectedly.

2. Identify your patient’s personal resources for support (e.g., family, friends) as part of your management of patients facing crisis.

3. Offer appropriate community resources (e.g., counselor) as part of your ongoing management of patients with a crisis.

5. Use psychoactive medication rationally to assist patients in crisis.

6. Inquire about unhealthy coping methods (e.g., drugs, alcohol, eating, gambling, violence, sloth) in your patients facing crisis.

7. Ask your patient if there are others needing help as a consequence of the crisis.

8. Negotiate a follow-up plan with patients facing crisis.

9. Be careful not to cross boundaries when treating patients in crisis (e.g., lending money, appointments outside regular hours).

10. Prepare your practice environment for possible crisis or disaster and include colleagues and staff in the planning for both medical and non-medical crises.

11. When dealing with an unanticipated medical crisis (e.g., seizure, shoulder dystocia),
   a) Assess the environment for needed resources (people, material).
   b) Be calm and methodical.
   c) Ask for the help you need.
Croup

1. In patients with croup,
   a) Identify the need for respiratory assistance (e.g., assess ABCs, fatigue, somnolence, paradoxical breathing, in drawing)
   b) Provide that assistance when indicated.

2. Before attributing stridor to croup, consider other possible causes (e.g., anaphylaxis, foreign body (airway or esophagus), retropharyngeal abscess, epiglottitis).

3. In any patient presenting with respiratory symptoms, look specifically for the signs and symptoms that differentiate upper from lower respiratory disease (e.g., stridor vs. wheeze vs. whoop).

4. In a child presenting with a clear history and physical examination compatible with mild to moderate croup, make the clinical diagnosis without further testing (e.g., do not routinely X-ray).

5. In patients with a diagnosis of croup, use steroids (do not under treat mild-to-moderate cases of croup).

6. In a patient presenting with croup, address parental concerns (e.g., not minimizing the symptoms and their impact on the parents), acknowledging fluctuating course of the disease, providing a plan anticipating recurrence of the symptoms.
Deep Venous Thrombosis

1 In patients complaining of leg pain and/or swelling, evaluate the likelihood of deep venous thrombosis (DVT) as investigation and treatment should differ according to the risk.

2 In patients with high probability for thrombotic disease (e.g., extensive leg clot, suspected pulmonary embolism) start anticoagulant therapy if tests will be delayed.

3 Identify patients likely to benefit from DVT prophylaxis.

4 Utilize investigations for DVT allowing for their limitations (e.g., Ultrasound and D-dimer).

5 In patients with established DVT use oral anticoagulation appropriately, (e.g., start promptly, watch for drug interactions, monitor lab values and adjust dose when appropriate, stop warfarin when appropriate, provide patient teaching).

6 Consider the possibility of an underlying coagulopathy in patients with DVT, especially when unexpected.

7 Use compression stockings in appropriate patients, to prevent and treat post-phlebitic syndrome.
Dehydration

1 When assessing the acutely ill patient, look for signs and symptoms of dehydration. (e.g., look for dehydration in the patient with a debilitating pneumonia).

2 In the dehydrated patient, assess the degree of dehydration using reliable indicators (e.g., vital signs) as some patients' hydration status may be more difficult to assess (e.g., elderly, very young, pregnant).

3 In a dehydrated patient,
a) Determine the appropriate volume of fluid for replacement of deficiency and ongoing needs,
b) Use the appropriate route (oral if the patient is able; IV when necessary).

4 When treating severe dehydration, use objective measures (e.g., lab values) to direct ongoing management.

5 In a dehydrated patient,
a) Identify the precipitating illness or cause, especially looking for non-gastro-intestinal, including drug-related, causes,
b) Treat the precipitating illness concurrently.

6 Treat the dehydrated pregnant patient aggressively, as there are additional risks of dehydration in pregnancy.
Dementia

1 In patients with early, non-specific signs of cognitive impairment:
   a) Suspect dementia as a diagnosis.
   b) Use the Mini-Mental State Examination and other measures of impaired cognitive function, as well as a careful history and physical examination, to make an early positive diagnosis.

2 In patients with obvious cognitive impairment, select proper laboratory investigations and neuroimaging techniques to complement the history and physical findings and to distinguish between dementia, delirium, and depression.

3 In patients with dementia, distinguish Alzheimer's disease from other dementias, as treatment and prognosis differ.

4 In patients with dementia who exhibit worsening function, look for other diagnoses (i.e., don't assume the dementia is worsening). These diagnoses may include depression or infection.

5 Disclose the diagnosis of dementia compassionately, and respect the patient's right to autonomy, confidentiality, and safety.

6 In patients with dementia, assess competency. (Do not judge clearly competent patients as incompetent and vice versa.)

7 In following patients diagnosed with dementia:
   a) Assess function and cognitive impairment on an ongoing basis.
   b) Assist with and plan for appropriate interventions (e.g., deal with medication issues, behavioural disturbance management, safety issues, caregiver issues, comprehensive care plans, driving safety, and placement).

8 Assess the needs of and supports for caregivers of patients with dementia.

9 Report to the appropriate authorities patients with dementia who you suspect should not be driving.

10 In patients with dementia, look for possible genetic factors to provide preventive opportunities to other family members, and to aid in appropriate decision-making (e.g., family planning).

Note: Specific cognition-enhancing pharmacotherapy (initiation/discontinuation) may be assessed later, as controversy on indications diminishes.
Depression

1. In a patient with a diagnosis of depression:
   a) Assess the patient for the risk of suicide.
   b) Decide on appropriate management (i.e., hospitalization or close follow-up, which will depend, for example, on severity of symptoms, psychotic features, and suicide risk).

2. Screen for depression and diagnose it in high-risk groups (e.g., certain socio-economic groups, those who suffer from substance abuse, postpartum women, people with chronic pain).

3. In a patient presenting with multiple somatic complaints for which no organic cause is found after appropriate investigations, consider the diagnosis of depression and explore this possibility with the patient.

4. After a diagnosis of depression is made, look for and diagnose other co-morbid psychiatric conditions (e.g., anxiety, bipolar disorder, personality disorder).

5. In a patient diagnosed with depression, treat appropriately:
   - drugs, psychotherapy.
   - monitor response to therapy.
   - active modification (e.g., augmentation, dose changes, drug changes).
   - referral as necessary.

6. In a patient presenting with symptoms consistent with depression, consider and rule out serious organic pathology, using a targeted history, physical examination, and investigations (especially in elderly or difficult patients).

7. In patients presenting with depression, inquire about abuse:
   - sexual, physical, and emotional abuse (past and current, witnessed or inflicted).
   - substance abuse.

8. In a patient with depression, differentiate major depression from adjustment disorder, dysthymia, and a grief reaction.

9. Following failure of an appropriate treatment in a patient with depression, consider other diagnoses (e.g., bipolar disorder, schizoaffective disorder, organic disease).

10. In the very young and elderly presenting with changes in behaviour, consider the diagnosis of depression (as they may not present with classic features).
Diabetes

1. Given a symptomatic or asymptomatic patient at high risk for diabetes (e.g., patients with gestational diabetes, obese, certain ethnic groups, and those with a strong family history), screen at appropriate intervals with the right tests to confirm the diagnosis.

2. Given a patient diagnosed with diabetes, either new-onset or established, treat and modify treatment according to disease status (e.g., use oral hypoglycemic agents, insulin, diet, and/or lifestyle changes).

3. Given a patient with established diabetes, advise about signs and treatment of hypoglycemia/hyperglycemia during an acute illness or stress (i.e., gastroenteritis, physiologic stress, decreased intake).

4. In a patient with poorly controlled diabetes, use effective educational techniques to advise about the importance of optimal glycemic control through compliance, lifestyle modification, and appropriate follow-up and treatment.

5. In patients with established diabetes:
   a) Look for complications (e.g., proteinuria).
   b) Refer them as necessary.

6. In the acutely ill diabetic patient, diagnose the underlying cause of the illness and investigate for diabetic ketoacidosis and hyperglycemia.

7. Given a patient with diabetic ketoacidosis, manage the problem appropriately and advise about preventing future episodes.
Diarrhea

1. In all patients with diarrhea,
   a) Determine hydration status,
   b) Treat dehydration appropriately.

2. In patients with acute diarrhea, use history to establish the possible etiology (e.g., infectious contacts, travel, recent antibiotic or other medication use, common eating place for multiple ill patients).

3. In patients with acute diarrhea who have had recent hospitalization or recent antibiotic use, look for clostridium difficile.

4. In patients with acute diarrhea, counsel about the timing of return to work/school (re: the likelihood of infectivity).

5. Pursue investigation, in a timely manner, of elderly with unexplained diarrhea, as they are more likely to have pathology.

6. In a young person with chronic or recurrent diarrhea, with no red flag symptoms or signs, use established clinical criteria to make a positive diagnosis of irritable bowel syndrome (do not overinvestigate).

7. In patients with chronic or recurrent diarrhea, look for both gastro-intestinal and non-gastro-intestinal symptoms and signs suggestive of specific diseases (e.g., inflammatory bowel disease, malabsorption syndromes, and compromised immune system).

</tbody>
</table>
Disability

1 Determine whether a specific decline in functioning (e.g., social, physical, emotional) is a disability for that specific patient.

2 Screen elderly patients for disability risks (e.g., falls, cognitive impairment, immobilization, decreased vision) on an ongoing basis.

3 In patients with chronic physical problems (e.g., arthritis, multiple sclerosis) or mental problems (e.g., depression), assess for and diagnose disability when it is present.

4 In a disabled patient, assess all spheres of function (emotional, physical, and social, the last of which includes finances, employment, and family).

5 For disabled patients, offer a multi-faceted approach (e.g., orthotics, lifestyle modification, time off work, community support) to minimize the impact of the disability and prevent further functional deterioration.

6 In patients at risk for disability (e.g., those who do manual labour, the elderly, those with mental illness), recommend primary prevention strategies (e.g., exercises, braces, counselling, work modification).

7 Do not limit treatment of disabling conditions to a short-term disability leave (i.e., time off is only part of the plan).
**Dizziness**

1. In patients complaining of dizziness, rule out serious cardiovascular, cerebrovascular, and other neurologic disease (e.g., arrhythmia, myocardial infarction [MI], stroke, multiple sclerosis).

2. In patients complaining of dizziness, take a careful history to distinguish vertigo, presyncope, and syncope.

3. In patients complaining of dizziness, measure postural vital signs.

4. Examine patients with dizziness closely for neurologic signs.

5. In hypotensive dizzy patients, exclude serious conditions (e.g., MI, abdominal aortic aneurysm, sepsis, gastrointestinal bleeding) as the cause.

6. In patients with chronic dizziness, who present with a change in baseline symptoms, reassess to rule out serious causes.

7. In a dizzy patient, review medications (including prescription and over-the-counter medications) for possible reversible causes of the dizziness.

8. Investigate further those patients complaining of dizziness who have:
   - signs or symptoms of central vertigo.
   - a history of trauma.
   - signs, symptoms, or other reasons (e.g., anticoagulation) to suspect a possible serious underlying cause.
Domestic Violence (Sexual, Physical, Psychological)

1. In a patient with new, obvious risks for domestic violence, take advantage of opportunities in pertinent encounters to screen for domestic violence (e.g., periodic annual exam, visits for anxiety/depression, ER visits).

2. In a patient in a suspected or confirmed situation of domestic violence:
   a) Assess the level of risk and the safety of children (i.e., the need for youth protection).
   b) Advise about the escalating nature of domestic violence.

3. In a situation of suspected or confirmed domestic violence, develop, in collaboration with the patient, an appropriate emergency plan to ensure the safety of the patient and other household members.

4. In a patient living with domestic violence, counsel about the cycle of domestic violence and feelings associated with it (e.g., helplessness, guilt), and its impact on children.
Dyspepsia

1 In a patient presenting with dyspepsia, include cardiovascular disease in the differential diagnosis.

2 Attempt to differentiate, by history and physical examination, between conditions presenting with dyspepsia (e.g., gastroesophageal reflux disease, gastritis, ulcer, cancer), as plans for investigation and management may be very different.

3 In a patient presenting with dyspepsia, ask about and examine the patient for worrisome signs/symptoms (e.g., gastrointestinal bleeding, weight loss, dysphagia).
Dysuria

1. In a patient presenting with dysuria, use history and dipstick urinalysis to determine if the patient has an uncomplicated urinary tract infection.

2. When a diagnosis of uncomplicated urinary tract infection is made, treat promptly without waiting for a culture result.

3. Consider non-urinary tract infection related etiologies of dysuria (e.g., prostatitis, vaginitis, sexually transmitted infection, chemical irritation) and look for them when appropriate.

4. When assessing patients with dysuria, identify those at higher risk of complicated urinary tract infection (e.g., pregnancy, children, diabetes, urolithiasis).

5. In patients with recurrent dysuria, look for a specific underlying cause (e.g., post-coital urinary tract infection, atrophic vaginitis, retention).
Earache

1. Make the diagnosis of otitis media (OM) only after good visualization of the eardrum (i.e., wax must be removed), and when sufficient changes are present in the eardrum, such as bulging or distorted light reflex (i.e., not all red eardrums indicate OM).

2. Include pain referred from other sources in the differential diagnosis of an earache (e.g., Tooth abscess, trigeminal Neuralgia, TMJ dysfunction, pharyngitis, etc.).

3. Consider serious causes in the differential diagnosis of an earache (e.g., tumors, temporal arteritis, mastoiditis).

4. In the treatment of otitis media, explore the possibility of not giving antibiotics, thereby limiting their use (e.g., through proper patient selection and patient education because most otitis Media is of viral origin), and by ensuring good follow-up (e.g., reassessment in 48 hours).

5. Make rational drug choices when selecting antibiotic therapy for the treatment of otitis media. (Use first-line agents unless given a specific indication not to.)

6. In patients with earache (especially those with otitis media), recommend appropriate pain control (oral analgesics).

7. In a child with a fever and a red eardrum, look for other possible causes of the fever (i.e., do not assume that the red ear is causing the fever).*

8. Test children with recurrent ear infections for hearing loss.

Note: *See the key features on fever.
Eating Disorders

1. Whenever teenagers present for care, include an assessment of their risk of eating disorders (e.g., altered body image, binging, and type of activities, as dancers, gymnasts, models, etc., are at higher risk). As this may be the only opportunity to do an assessment.

2. When diagnosing an eating disorder, take an appropriate history to differentiate anorexia nervosa from bulimia, as treatment and prognosis differ.

3. In a patient with an eating disorder, rule out co-existing psychiatric conditions (e.g., depression, personality disorder, obsessive-compulsive disorder, anxiety disorder).

4. When managing a patient with an eating disorder, use a multidisciplinary approach (e.g., work with a psychiatrist, a psychologist, a dietitian).

5. When assessing a patient presenting with a problem that has defied diagnosis (e.g., arrhythmias without cardiac disease, an electrolyte imbalance without drug use or renal impairment, amenorrhea without pregnancy), include “complication of an eating disorder” in the differential diagnosis.

6. In the follow-up care of a patient with a known eating disorder:
   a) Periodically look for complications (e.g., tooth decay, amenorrhea, an electrolyte imbalance).
   b) Evaluate the level of disease activity (e.g., by noting eating patterns, exercise, laxative use).
Elderly

1 In the elderly patient taking multiple medications, avoid polypharmacy by:
   - monitoring side effects.
   - periodically reviewing medication (e.g., is the medication still indicated, is the dosage appropriate).
   - monitoring for interactions.

2 In the elderly patient, actively inquire about non-prescription medication use (e.g., herbal medicines, cough drops, over-the-counter drugs, vitamins).

3 In the elderly patient, screen for modifiable risk factors (e.g., visual disturbance, impaired hearing) to promote safety and prolong independence.

4 In the elderly patient, assess functional status to:
   - anticipate and discuss the eventual need for changes in the living environment.
   - ensure that social support is adequate.

5 In older patients with diseases prone to atypical presentation, do not exclude these diseases without a thorough assessment (e.g., pneumonia, appendicitis, depression).
Epistaxis

1 Through history and/or physical examination, assess the hemodynamic stability of patients with epistaxis.

2 While attending to active nose bleeds, recognize and manage excessive anxiety in the patient and accompanying family.

3 In a patient with an active or recent nosebleed, obtain a focused history to identify possible etiologies (e.g., recent trauma, recent upper respiratory infection, medications).

4 In a patient with an active or recent nosebleed,
   a) Look for and identify anterior bleeding sites,
   b) Stop the bleeding with appropriate methods.

5 In a patient with ongoing or recurrent bleeding in spite of treatment, consider a posterior bleeding site.

6 In a patient with a nosebleed, obtain lab work only for specific indications (e.g., unstable patient, suspicion of a bleeding diathesis, use of anticoagulation)

7 In a patient with a nosebleed, provide thorough aftercare instructions (e.g., how to stop a subsequent nose bleed, when to return, humidification, etc.)
Family Issues

1. Routinely ask about family issues to understand their impact on the patient’s illness and the impact of the illness on the family.

2. Explore family issues:
   - periodically.
   - at important life-cycle points (e.g., when children move out, after the birth of a baby).
   - when faced with problems not resolving in spite of appropriate therapeutic interventions (e.g., medication compliance, fibromyalgia, hypertension).
Fatigue

1. In all patients complaining of fatigue, include depression in the differential diagnosis.

2. Ask about other constitutional symptoms as part of a systematic approach to rule out underlying medical causes in all patients complaining of fatigue.

3. Exclude adverse effects of medication as the cause in all patients complaining of fatigue.

4. Avoid early, routine investigations in patients with fatigue unless specific indications for such investigations are present.

5. Given patients with fatigue in whom other underlying disorders have been ruled out, assist them to place, in a therapeutic sense, the role of their life circumstances in their fatigue.

6. In patients whose fatigue has become chronic, manage supportively, while remaining vigilant for new diseases and illnesses.
In febrile infants 0-3 months old:
   a) Recognize the risk of occult bacteremia.
   b) Investigate thoroughly (e.g., blood cultures, urine, lumbar puncture +/- chest X-ray).

In a febrile patient with a viral infection, do NOT prescribe antibiotics.

In a febrile patient requiring antibiotic therapy, prescribe the appropriate antibiotic(s) according to likely causative organism(s) and local resistance patterns.

Investigate patients with fever of unknown origin appropriately (e.g., with blood cultures, echocardiography, bone scans).

In febrile patients, consider life-threatening infectious causes (e.g., endocarditis, meningitis).

Aggressively and immediately treat patients who have fever resulting from serious causes before confirming the diagnosis, whether these are infectious (e.g., febrile neutropenia, septic shock, meningitis) or non-infectious (e.g., heat stroke, drug reaction, malignant neuroleptic syndrome).

In the febrile patient, consider causes of hyperthermia other than infection (e.g., heat stroke, drug reaction, malignant neuroleptic syndrome).

In an elderly patient, be aware that no good correlation exists between the presence or absence of fever and the presence or absence of serious pathology.
Fractures

1. In a patient with multiple injuries, stabilize the patient (e.g., airway, breathing, and circulation, and life-threatening injuries) before dealing with any fractures.

2. When examining patients with a fracture, assess neurovascular status and examine the joint above and below the injury.

3. In patients with suspected fractures that are prone to have normal X-ray findings (e.g., scaphoid fractures in wrist injuries, elbow fracture, growth plate fracture in children, stress fractures), manage according to your clinical suspicion, even if X-rays are normal.

4. In assessing elderly patients with an acute change in mobility (i.e., those who can no longer walk) and equivocal X-ray findings (e.g., no obvious fracture), investigate appropriately (e.g., with bone scans, computed tomography) before excluding a fracture.

5. Identify and manage limb injuries that require urgent immobilization and/or reduction in a timely manner.

6. In assessing patients with suspected fractures, provide analgesia that is timely (i.e., before X-rays) and adequate (e.g., narcotic) analgesia.

7. In patients presenting with a fracture, look for and diagnose high-risk complications (e.g., an open fracture, unstable cervical spine, compartment syndrome).

8. Use clinical decision rules (e.g., Ottawa ankle rules, C-spine rules, and knee rules) to guide the use of X-ray examinations.

Note: These key features do not include technical and or psychomotor skills such as casting, reduction of dislocations, etc. See Procedural Skills.
Gastro-intestinal Bleed

1. In a patient with blood in the stools who is hemodynamically stable, use history to differentiate upper vs. lower gastro-intestinal (GI) bleed as the investigation differs.

2. In a patient with suspected blood in the stool, explore other possible causes (e.g., beet ingestion, iron, Pepto-Bismol) before doing extensive investigation.

3. Look for patients at higher risk for GI bleed (e.g., previous GI bleed, intensive care unit admission, nonsteroidal anti-inflammatory drugs, alcohol) so as to modify treatment to reduce risk of GI bleed (e.g., cytoprotection).

4. In a patient with obvious GI bleeding, identify patients who may require timely treatment even though they are not yet in shock.

5. In a stable patient with lower GI bleeding, look for serious causes (e.g., malignancy, inflammatory bowel disease, ulcer, varices) even when there is an apparent obvious cause for the bleeding (e.g., do not attribute a rectal bleed to hemorrhoids or to oral anticoagulation).

6. In a patient with an upper GI bleed,
   a) Include variceal bleeding in your differential,
   b) Use history and physical examination to assess the likelihood of a variceal bleed as its management differs.
Gender Specific Issues

1 In the assessment of clinical problems that might present differently in men and women, maintain an inclusive differential diagnosis that allows for these differences (e.g., women with coronary artery disease, depression in males).

2 As part of caring for women with health concerns, assess the possible contribution of domestic violence.

3 When men and women present with stress-related health concerns, assess the possible contribution of role-balancing issues (e.g., work-life balance or between partners).

4 Establish office policies and practices to ensure patient comfort and choice, especially with sensitive examinations (e.g., positioning for Pap, chaperones for genital/rectal exams).

5 Interpret and apply research evidence for your patients in light of gender bias present in clinical studies (e.g., ASA use in women).
Grief

1 In patients who have undergone a loss, prepare them for the types of reactions (e.g., emotional, physical) that they may experience.

2 In all grieving patients, especially those with a prolonged or abnormal grief reaction, inquire about depression or suicidal ideation.

3 Recognize atypical grief reactions in the very young or the elderly (e.g., behavioral changes).

4 In patients with a presentation suggestive of a grief reaction without an obvious trigger, look for triggers that may be unique to the patient (e.g., death of a pet, loss of a job).
Headache

1 Given a patient with a new-onset headache, differentiate benign from serious pathology through history and physical examination.

2 Given a patient with worrisome headache suggestive of serious pathology (e.g., meningitis, tumour, temporal arteritis, subarachnoid bleed):
   a) Do the appropriate work-up (e.g., biopsy, computed tomography [CT], lumbar puncture [LP], erythrocyte sedimentation rate).
   b) Make the diagnosis.
   c) Begin timely appropriate treatment (i.e., treat before a diagnosis of temporal arteritis or meningitis is confirmed).
   d) Do not assume that relief of symptoms with treatment excludes serious pathology.

3 Given a patient with a history of chronic and/or relapsing headache (e.g., tension, migraine, cluster, narcotic-induced, medication-induced), treat appropriately, and avoid narcotic, barbiturate dependence.

4 In a patient with a history of suspected subarachnoid bleed and a negative CT scan, do a lumbar puncture.

5 In a patient suffering from acute migraine headache:
   a) Treat the episode.
   b) Assess the ongoing treatment plan. (referral when necessary, take a stepwise approach).
Hepatitis

1. In a patient presenting with hepatitis symptoms and/or abnormal liver function tests, take a focused history to assist in establishing the etiology (e.g., new drugs, alcohol, blood or body fluid exposure, viral hepatitis).

2. In a patient with abnormal liver enzyme tests interpret the results to distinguish between obstructive and hepatocellular causes for hepatitis as the subsequent investigation differs.

3. In a patient where an obstructive pattern has been identified,
   a) Promptly arrange for imaging,
   b) Refer for more definitive management in a timely manner.

4. In patients positive for Hepatitis B and/or C,
   a) Assess their infectiousness,
   b) Determine human immunodeficiency virus status.

5. In patients who are Hepatitis C antibody positive determine those patients who are chronically infected with Hepatitis C, because they are at greater risk for cirrhosis and hepatocellular cancer.

6. In patients who are chronically infected with Hepatitis C, refer for further assessment and possible treatment.

7. In patients who are at risk for Hepatitis B and/or Hepatitis C exposure,
   a) Counsel about harm reduction strategies, risk of other blood borne diseases,
   b) Vaccinate accordingly.

8. Offer post-exposure prophylaxis to patients who are exposed or possibly exposed to Hepatitis A or B.

9. Periodically look for complications (e.g., cirrhosis, hepatocellular cancer) in patients with chronic viral hepatitis, especially hepatitis C infection.
Hyperlipidemia

1. Screen appropriate patients for hyperlipidemia.

2. In all patients whose cardiovascular risk is being evaluated, include the assessment of lipid status.

3. When hyperlipidemia is present, take an appropriate history, and examine and test the patient for modifiable causes (e.g., alcohol abuse, thyroid disease).

4. Ensure that patients diagnosed with hyperlipidemia receive appropriate lifestyle and dietary advice. Periodically reassess compliance with this advice (especially in patients at overall low or moderate CV risk).

5. In treating hyperlipidemic patients, establish target lipid levels based on overall CV risk.

Hypertension

1 Screen for hypertension.

2 Use correct technique and equipment to measure blood pressure.

3 Make the diagnosis of hypertension only after multiple BP readings (i.e., at different times and during different visits).

4 In patients with an established diagnosis of hypertension, assess and re-evaluate periodically the overall cardiovascular risk and end-organ complications:
   a) Take an appropriate history.
   b) Do the appropriate physical examination.
   c) Arrange appropriate laboratory investigations.

5 In appropriate patients with hypertension (e.g., young patients requiring multiple medications, patients with an abdominal bruit, patients with hypokalemia in the absence of diuretics):
   a) Suspect secondary hypertension.
   b) Investigate appropriately.

6 Suggest individualized lifestyle modifications to patients with hypertension. (e.g., weight loss, exercise, limit alcohol consumption, dietary changes).

7 In a patient diagnosed with hypertension, treat the hypertension with appropriate pharmacologic therapy (e.g., consider the patient’s age, concomitant disorders, other cardiovascular risk factors).

8 Given a patient with the signs and symptoms of hypertensive urgency or crisis, make the diagnosis and treat promptly.

9 In all patients diagnosed with hypertension, assess response to treatment, medication compliance, and side effects at follow-up visits.
Imigrants

1 As part of the periodic health assessment of newly arrived immigrants:
   a) Assess vaccination status (as it may not be up to date).
   b) Provide the necessary vaccinations to update their status.

2 As part of the ongoing care of immigrants, modify your approach (when possible) as required by
   their cultural context (e.g., history given only by husband, may refuse examination by a male
   physician, language barriers).

3 When dealing with a language barrier, make an effort to obtain the history with the help of a
   medical interpreter and recognize the limitations of all interpreters (e.g., different agendas, lack
   of medical knowledge, something to hide).

4 As part of the ongoing care of all immigrants (particularly those who appear not to be coping):
   a) Screen for depression (i.e., because they are at higher risk and frequently isolated).
   b) Inquire about a past history of abuse or torture.
   c) Assess patients for availability of resources for support (e.g., family, community
      organizations).

5 In immigrants presenting with a new or ongoing medical condition, consider in the differential
   diagnosis infectious diseases acquired before immigration (e.g., malaria, parasitic disease,
   tuberculosis).

6 As part of the ongoing care of all immigrants, inquire about the use of alternative healers,
   practices, and/or medications (e.g., “natural” or herbal medicines, spiritual healers, medications
   from different countries, moxibustion).
Immunization

1. Do not delay immunizations unnecessarily (e.g., vaccinate a child even if he or she has a runny nose).

2. With parents who are hesitant to vaccinate their children, explore the reasons, and counsel them about the risks of deciding against routine immunization of their children.

3. Identify patients who will specifically benefit from immunization (e.g., not just the elderly and children, but also the immunosuppressed, travellers, those with sickle cell anemia, and those at special risk for pneumonia and hepatitis A and B), and ensure it is offered.

4. Clearly document immunizations given to your patients.

5. In patients presenting with a suspected infectious disease, assess immunization status, as the differential diagnosis and consequent treatment in unvaccinated patients is different.

6. In patients presenting with a suspected infectious disease, do not assume that a history of vaccination has provided protection against disease (e.g., pertussis, rubella, diseases acquired while travelling).
1 When evaluating children, generate a differential diagnosis that accounts for common medical problems, which may present differently in children (e.g., urinary tract infections, pneumonia, appendicitis, depression).

2 As children, especially adolescents, generally present infrequently for medical care, take advantage of visits to ask about:
- unverbalized problems (e.g., school performance).
- social well-being (e.g., relationships, home, friends).
- modifiable risk factors (e.g., exercise, diet).
- risk behaviours (e.g., use of bike helmets and seatbelts).

3 At every opportunity, directly ask questions about risk behaviours (e.g., drug use, sex, smoking, driving) to promote harm reduction.

4 In adolescents, ensure the confidentiality of the visit, and, when appropriate, encourage open discussion with their caregivers about specific problems (e.g., pregnancy, depression and suicide, bullying, drug abuse).

5 In assessing and treating children, use age-appropriate language.

6 In assessing and treating children, obtain and share information with them directly (i.e., don’t just talk to the parents).

7 When investigation is appropriate, do not limit it because it may be unpleasant for those involved (the child, parents, or health care providers).
Infections

1 In patients with a suspected infection,
   a) Determine the correct tools (e.g., swabs, culture/transport medium), techniques, and
      protocols for cultures,
   b) Culture when appropriate (e.g., throat swabs/sore throat guidelines).

2 When considering treatment of an infection with an antibiotic, do so
   a) Judiciously (e.g., delayed treatment in otitis media, with comorbid illness in acute
      bronchitis),
   b) Rationally (e.g., cost, guidelines, comorbidity, local resistance patterns).

3 Treat infections empirically when appropriate (e.g., in life threatening sepsis without culture
   report or confirmed diagnosis, candida vaginitis post-antibiotic use).

4 Look for infection as a possible cause in a patient with an ill-defined problem (e.g., confusion in
   the elderly, failure to thrive, unexplained pain [necrotizing fasciitis, abdominal pain in children
   with pneumonia]).

5 When a patient returns after an original diagnosis of a simple infection and is deteriorating or not
   responding to treatment, think about and look for more complex infection. (i.e., When a patient
   returns complaining they are not getting better, don’t assume the infection is just slow to
   resolve).

6 When treating infections with antibiotics use other therapies when appropriate (e.g., aggressive
   fluid resuscitation in septic shock, incision and drainage abscess, pain relief).
Infertility

1 When a patient consults you with concerns about difficulties becoming pregnant:
   a) Take an appropriate history (e.g., ask how long they have been trying, assess menstrual history, determine coital frequency and timing) before providing reassurance or investigating further.
   b) Ensure follow-up at an appropriate time (e.g., after one to two years of trying; in general, do not investigate infertility too early).

2 In patients with fertility concerns, provide advice that accurately describes the likelihood of fertility.

3 With older couples who have fertility concerns, refer earlier for investigation and treatment, as their likelihood of infertility is higher.

4 When choosing to investigate primary or secondary infertility, ensure that both partners are assessed.

5 In couples who are likely infertile, discuss adoption when the time is right. (Remember that adoption often takes a long time.)

6 In evaluating female patients with fertility concerns and menstrual abnormalities, look for specific signs and symptoms of certain conditions (e.g., polycystic ovarian syndrome, hyperprolactinemia, thyroid disease) to direct further investigations (e.g., prolactin, thyroid-stimulating hormone, and luteal phase progesterone testing).
Insomnia

1 In patients presenting with sleep complaints, take a careful history to:
   - distinguish insomnia from other sleep-related complaints that require more specific treatment (e.g., sleep apnea or other sleep disorders, including periodic limb movements, restless legs syndrome, sleepwalking, or sleep talking).
   - assess the contribution of drugs (prescription, over-the-counter, recreational), caffeine, and alcohol.
   - make a specific psychiatric diagnosis if one is present.

2 When assessing patients with sleep complaints, obtain a collateral history from the bed partner, if possible.

3 In all patients with insomnia, provide advice about sleep hygiene (e.g., limiting caffeine, limiting naps, restricting bedroom activities to sleep and sex, using an alarm clock to get up at the same time each day).

4 In appropriate patients with insomnia, use hypnotic medication judiciously (e.g., prescribe it when there is a severe impact on function, but do not prescribe it without a clear indication).
Ischemic Heart Disease

1. Given a specific clinical scenario in the office or emergency setting, diagnose presentations of ischemic heart disease (IHD) that are:
   - classic.
   - atypical (e.g., in women, those with diabetes, the young, those at no risk).

2. In a patient with modifiable risk factors for ischemic heart disease (e.g., smoking, diabetes control, obesity), develop a plan in collaboration with the patient to reduce her or his risk of developing the disease.

3. In a patient presenting with symptoms suggestive of ischemic heart disease but in whom the diagnosis may not be obvious, do not eliminate the diagnosis solely because of tests with limited specificity and sensitivity (e.g., electrocardiography, exercise stress testing, normal enzyme results).

4. In a patient with stable ischemic heart disease manage changes in symptoms with self-initiated adjustment of medication (e.g., nitroglycerin) and appropriate physician contact (e.g., office visits, phone calls, emergency department visits), depending on the nature and severity of symptoms.

5. In the regular follow-up care of patients with established ischemic heart disease, specifically verify the following to detect complications and suboptimal control:
   - symptom control.
   - medication adherence.
   - impact on daily activities.
   - lifestyle modification.
   - clinical screening (i.e., symptoms and signs of complications).

6. In a person with diagnosed acute coronary syndrome (e.g., cardiogenic shock, arrhythmia, pulmonary edema, acute myocardial infarction, unstable angina), manage the condition in an appropriate and timely manner.
Joint Disorder

1 In a patient presenting with joint pain, distinguish benign from serious pathology (e.g., sarcoma, septic joint):
   a) By taking pertinent history
   b) By investigating in a timely and appropriate manner (e.g., aspirate, blood work, an X-ray examination).

2 In a patient presenting with non-specific musculoskeletal pain, make a specific rheumatologic diagnosis when one is evident through history, physical examination, and investigations. (e.g., gout, fibromyalgia, monoarthropathy vs. polyarthropathy).

3 In a patient presenting with a monoarthropathy, rule out infectious causes. (e.g., sexually transmitted infections).

4 In patients presenting with musculoskeletal pain, include referred and visceral sources of pain in the differential diagnosis. (e.g., angina, slipped capital epiphysis presenting as knee pain, neuropathic pain).

5 Clinically diagnose ligamentous injuries. Do NOT do an X-ray examination.

6 In a patient presenting with joint pain, include systemic conditions in the differential diagnosis (e.g., Wegener’s granulomatosis, lupus, ulcerative colitis).

7 In patients with a diagnosed rheumatologic condition:
   a) Actively inquire about pre-existing co-morbid conditions that may modify the treatment plan.
   b) Choose the appropriate treatment plan (e.g., no nonsteroidal anti-inflammatory drugs in patients with renal failure or peptic ulcer disease).

8 In assessing patients with a diagnosed rheumatologic condition, search for disease-related complications (e.g., iritis).

9 In patients experiencing musculoskeletal pain:
   a) Actively inquire about the impact of the pain on daily life.
   b) Treat with appropriate doses of analgesics.
   c) Arrange for community resources and aids (e.g., splints, cane), if necessary.

10 In patients with rheumatoid arthritis, start treatment with disease-modifying agents within an appropriate time interval.
Lacerations

1. When managing a laceration, identify those that are more complicated and may require special skills for repair (e.g., a second- versus third-degree perineal tear, lip or eyelid lacerations involving margins, arterial lacerations).

2. When managing a laceration, look for complications (e.g., flexor tendon lacerations, open fractures, bites to hands or face, neurovascular injury, foreign bodies) requiring more than simple suturing.

3. Given a deep or contaminated laceration, thoroughly clean with copious irrigation and debride when appropriate, before closing.

4. Identify wounds at high risk of infection (e.g., puncture wounds, some bites, some contaminated wounds), and do not close them.

5. When repairing lacerations in children, ensure appropriate analgesia (e.g., topical anesthesia) and/or sedation (e.g., procedural sedation) to avoid physical restraints.

6. When repairing a laceration, allow for and take adequate time to use techniques that will achieve good cosmetic results (e.g., layer closure, revision if necessary, use of regional rather than local anesthesia).

7. In treating a patient with a laceration:
   a) Ask about immunization status for tetanus.
   b) Immunize the patient appropriately.
Learning

Patients:

1  As part of the ongoing care of children, ask parents about their children’s functioning in school to identify learning difficulties.

2  In children with school problems, take a thorough history to assist in making a specific diagnosis of the problem (e.g., mental health problem, learning disability, hearing).

3  When caring for a child with a learning disability, regularly assess the impact of the learning disability on the child and the family.

4  When caring for a child with a learning disability, ensure the patient and family have access to available community resources to assist them.

5  To maximize the patient’s understanding and management of their condition,
   a)  Determine their willingness to receive information,
   b)  Match the complexity and amount of information provided with the patient’s ability to understand.

Self Learning:

6  Continuously assess your learning needs.

7  Effectively address your learning needs.

8  Incorporate your new knowledge into your practice.
Lifestyle

1. In the ongoing care of patients, ask about behaviours that, if changed, can improve health (e.g., diet, exercise, alcohol use, substance use, safer sex, injury prevention (e.g., seatbelts and helmets)).

2. Before making recommendations about lifestyle modification, explore a patient's readiness to change, as it may alter advice.

3. Explore a person's context (e.g., poverty) before making recommendations about lifestyle modification (e.g., healthy eating choices, exercise suggestions) so as to avoid making recommendations incompatible with the patient's context.

4. In the ongoing care of patients, periodically review their behaviours, recognizing that these may change.

5. In the ongoing care of a patient, regularly reinforce advice about lifestyle modification, whether or not the patient has instituted a change in behaviour.
Loss of Consciousness

1. In an unconscious patient, assess ABC’s and resuscitate as needed.

2. As part of the assessment of a patient who has lost consciousness, obtain focused history from the patient or witnesses that would include duration, trauma, preexisting conditions, drugs, toxins, medications and seizure activity.

3. Examine unconscious patients for localizing and diagnostic signs (e.g., ketone smell, liver flap, focal neurologic signs).

4. In patients with a loss of consciousness and a history of head trauma, rule out intracranial bleeding.

5. In patients with a loss of consciousness who are anticoagulated, rule out intracranial bleeding.

6. Assess and treat unconscious patients urgently for reversible conditions (e.g., shock, hypoxia, hypoglycemia, hyperglycemia, and narcotic overdose).

7. When following up patients who have lost consciousness, assess and advise regarding return to work, sporting, driving and recreational activities to minimize the possibility of injury to self or others in the event of a recurrence.

8. In patients who have had a loss of consciousness without a clear diagnosis, pursue investigations (e.g., rule out transient arythmia, seizure).

9. When following up patients who have lost consciousness and where there is potential for recurrent episodes, discuss specific preventive and protective measures (e.g., position changes with orthostatic pressure changes).

10. In patients with loss of consciousness following head trauma, treat and follow up according to current concussion guidelines.

11. Advise authorities about appropriate patients with loss of consciousness (e.g., regarding driving status).
Loss of Weight

1. Pursue an underlying cause in a patient with unexplained weight loss through history, physical examination (including weight) and appropriate investigations.

2. Maintain an ongoing record of patients’ weights so as to accurately determine when true weight loss has occurred.

3. In patients with persistent weight loss of undiagnosed cause, follow-up and reevaluate in a timely manner in order to decide whether anything needs to be done.
Low-back Pain

1 In a patient with undefined acute low-back pain (LBP):
   a) Rule out serious causes (e.g., cauda equina syndrome, pyelonephritis, ruptured abdominal aortic aneurysm, cancer) through appropriate history and physical examination.
   b) Make a positive diagnosis of musculoskeletal pain (not a diagnosis of exclusion) through an appropriate history and physical examination.

2 In a patient with confirmed mechanical low back pain:
   a) Do not over-investigate in the acute phase.
   b) Advise the patient:
      - that symptoms can evolve, and ensure adequate follow-up care.
      - that the prognosis is positive (i.e., the overwhelming majority of cases will get better).

3 In a patient with mechanical low back pain, whether it is acute or chronic, give appropriate analgesia and titrate it to the patient's pain.

4 Advise the patient with mechanical low back pain to return if new or progressive neurologic symptoms develop.

5 In all patients with mechanical low back pain, discuss exercises and posture strategies to prevent recurrences.
Meningitis

1. In the patient with a non-specific febrile illness, look for meningitis, especially in patients at higher risk (e.g., immuno-compromised individuals, alcoholism, recent neurosurgery, head injury, recent abdominal surgery, neonates, aboriginal groups, students living in residence).

2. When meningitis is suspected ensure a timely lumbar puncture.

3. In the differentiation between viral and bacterial meningitis, adjust the interpretation of the data in light of recent antibiotic use.

4. For suspected bacterial meningitis, initiate urgent empiric IV antibiotic therapy (i.e., even before investigations are complete).

5. Contact public health to ensure appropriate prophylaxis for family, friends and other contacts of each person with meningitis.
Menopause

1 In any woman of menopausal age, screen for symptoms of menopause and (e.g., hot flashes, changes in libido, vaginal dryness, incontinence, and psychological changes).

2 In a patient with typical symptoms suggestive of menopause, make the diagnosis without ordering any tests. (This diagnosis is clinical and tests are not required.)

3 In a patient with atypical symptoms of menopause (e.g., weight loss, blood in stools), rule out serious pathology through the history and selective use of tests, before diagnosing menopause.

4 In a patient who presents with symptoms of menopause but whose test results may not support the diagnosis, do not eliminate the possibility of menopause solely because of these results.

5 When a patient has contraindications to hormone-replacement therapy (HRT), or chooses not to take HRT: explore other therapeutic options and recommend some appropriate choices.

6 In menopausal or perimenopausal women:
   a) Specifically inquire about the use of natural or herbal products.
   b) Advise about potential effects and dangers (i.e., benefits and problems) of natural or herbal products and interactions.

7 In a menopausal or perimenopausal women, provide counselling about preventive health measures (e.g., osteoporosis testing, mammography).

8 Establish by history a patient’s hormone-replacement therapy risk/benefit status.
Mental Competency

1. In a patient with subtle symptoms or signs of cognitive decline (e.g., family concerns, medication errors, repetitive questions, decline in personal hygiene),
   a) Initiate assessment of mental competency, including use of a standardized tool,
   b) Refer for further assessment when necessary.

2. In a patient with a diagnosis that may predict cognitive impairment, (e.g., dementia, recent stroke, severe mental illness) identify those who require more careful assessment of decision-making capability.

3. When a patient is making decisions (e.g., surgery/no surgery, resuscitation status) think about the need to assess their mental competency.

4. In a patient with cognitive impairment, identify intact decision-making abilities, as many may be retained.
Multiple Medical Problems

1 In all patients presenting with multiple medical concerns (e.g., complaints, problems, diagnoses), take an appropriate history to determine the primary reason for the consultation.

2 In all patients presenting with multiple medical concerns, prioritize problems appropriately to develop an agenda that both you and the patient can agree upon (i.e., determine common ground).

3 In a patient with multiple medical complaints (and/or visits), consider underlying depression, anxiety, or abuse (e.g., physical, medication, or drug abuse) as the cause of the symptoms, while continuing to search for other organic pathology.

4 Given a patient with multiple defined medical conditions, periodically assess for secondary depression, as they are particularly at risk for it.

5 Periodically re-address and re-evaluate the management of patients with multiple medical problems in order to:
   - simplify their management (pharmacologic and other).
   - limit polypharmacy.
   - minimize possible drug interactions.
   - update therapeutic choices (e.g., because of changing guidelines or the patient's situation).

6 In patients with multiple medical problems and recurrent visits for unchanging symptoms, set limits for consultations when appropriate (e.g., limit the duration and frequency of visits).

Evaluation Objectives in Family Medicine: Topics and Key Features
Neck Pain

1 In patients with non-traumatic neck pain, use a focused history, physical examination and appropriate investigations to distinguish serious, non-musculoskeletal causes (e.g., lymphoma, carotid dissection), including those referred to the neck (e.g., myocardial infarction, pseudotumour cerebri) from other non-serious causes.

2 In patients with non-traumatic neck pain, distinguish by history and physical examination, those attributable to nerve or spinal cord compression from those due to other mechanical causes (e.g., muscular).

3 Use a multi-modal (e.g., physiotherapy, chiropractic, acupuncture, massage) approach to treatment of patients with chronic neck pain (e.g., degenerative disc disease +/- soft neuro signs).

4 In patients with neck pain following injury, distinguish by history and physical examination, those requiring an X-ray to rule out a fracture from those who do not require an X-ray (e.g., current guideline/C-spine rules).

5 When reviewing neck X-rays of patients with traumatic neck pain, be sure all vertebrae are visualized adequately.
Newborn

1. When examining a newborn, systematically look for subtle congenital anomalies (e.g., ear abnormalities, sacral dimple) as they may be associated with other anomalies and genetic syndromes.

2. In a newborn, where a concern has been raised by a caregiver (parent, nurse),
   a) Think about sepsis, and
   b) Look for signs of sepsis, as the presentation can be subtle (i.e. not the same as in adults, non-specific, feeding difficulties, respiratory changes)
   c) Make a provisional diagnosis of sepsis.

3. Resuscitate newborns according to current guidelines.

4. Maintain neonatal resuscitation skills if appropriate for your practice.

5. When a parent elects to bottle feed, support their decision in a non-judgemental manner.

6. In caring for a newborn ensure repeat evaluations for abnormalities that may become apparent over time (e.g., hips, heart, hearing).

7. When discharging a newborn from hospital,
   a) Advise parent(s) of warning signs of serious or impending illness, and
   b) Develop a plan with them to access appropriate care should a concern arise.
Obesity

1. In patients who appear to be obese, make the diagnosis of obesity using a clear definition (i.e., currently body mass index) and inform them of the diagnosis.

2. In all obese patients, assess for treatable co-morbidities such as hypertension, diabetes, coronary artery disease, sleep apnea, and osteoarthritis, as these are more likely to be present.

3. In patients diagnosed with obesity who have confirmed normal thyroid function, avoid repeated thyroid-stimulating hormone testing.

4. In obese patients, inquire about the effect of obesity on the patient's personal and social life to better understand its impact on the patient.

5. In a patient diagnosed with obesity, establish the patient’s readiness to make changes necessary to lose weight, as advice will differ, and reassess this readiness periodically.

6. Advise the obese patient seeking treatment that effective management will require appropriate diet, adequate exercise, and support (independent of any medical or surgical treatment), and facilitate the patient’s access to these as needed and as possible.

7. As part of preventing childhood obesity, advise parents of healthy activity levels for their children.

8. In managing childhood obesity, challenge parents to make appropriate family-wide changes in diet and exercise, and to avoid counterproductive interventions (e.g., berating or singling out the obese child).
Osteoporosis

1. Assess osteoporosis risk of all adult patients as part of their periodic health examination.

2. Use bone mineral density testing judiciously (e.g., don’t test everybody, follow a guideline).

3. Counsel all patients about primary prevention of osteoporosis (i.e., dietary calcium, physical activity, smoking cessation), especially those at higher risk (e.g., young female athletes, patients with eating disorders).

4. In menopausal or peri-menopausal women, provide advice about fracture prevention that includes improving their physical fitness, reducing alcohol, smoking cessation, risks of physical abuse, and environmental factors that may contribute to falls (e.g., don’t stop at suggesting calcium and vitamin D).

5. In patients with osteoporosis, avoid prescribing medications that may increase the risk of falls.

6. Provide advice and counseling about fracture prevention to older men, as they too are at risk for osteoporosis.

7. Treat patients with established osteoporosis regardless of their gender (e.g., use bisphosphonates in men).
Palliative Care

1 In all patients with terminal illnesses (e.g., end-stage congestive heart failure or renal disease), use the principles of palliative care to address symptoms (i.e., do not limit the use of palliative care to cancer patients).

2 In patients requiring palliative care, provide support through self, other related disciplines, or community agencies, depending on patient needs (i.e., use a team approach when necessary).

3 In patients approaching the end of life:
   a) Identify the individual issues important to the patient, including physical issues (e.g., dyspnea, pain, constipation, nausea), emotional issues, social issues (e.g., guardianship, wills, finances), and spiritual issues.
   b) Attempt to address the issues identified as important to the patient.

4 In patients with pain, manage it (e.g., adjust dosages, change analgesics) proactively through:
   - frequent reassessments.
   - monitoring of drug side effects (e.g., nausea, constipation, cognitive impairment).

5 In patients diagnosed with a terminal illness, identify and repeatedly clarify wishes about end-of-life issues (e.g., wishes for treatment of infections, intubation, dying at home).
In patients with suspected Parkinson’s disease, accurately distinguish idiopathic Parkinson’s disease from atypical Parkinson’s disease (e.g., disease at a young age, drug-related disease), as treatment differs.

In the care of all patients with Parkinson’s disease, involve other health care professionals to enhance the patient’s functional status.

In an elderly patient with a deterioration in functional status, look for and recognize Parkinson’s disease when it is present, as it is a potentially reversible contribution to the deterioration.

In a patient with a tremor, do an appropriate physical examination (e.g., observation, use of techniques to enhance the tremor) to distinguish the resting tremor of parkinsonism from other (e.g., essential) tremors.

As part of the management of patients with Parkinson’s disease, identify anticipated side effects of medications, especially those with which you are unfamiliar.

As part of the ongoing follow-up care of patients with Parkinson’s disease:
- assess functional status.
- monitor them for medication side effects.
- look for other problems (e.g., depression, dementia, falls, constipation), as they are more common.
Periodic Health Assessment/Screening

1. Do a periodic health assessment in a proactive or opportunistic manner (i.e., address health maintenance even when patients present with unrelated concerns).

2. In any given patient, selectively adapt the periodic health examination to that patient’s specific circumstances (i.e., adhere to inclusion and exclusion criteria of each manoeuvre/intervention, such as the criteria for mammography and prostate-specific antigen [PSA] testing).

3. In a patient requesting a test (e.g., PSA testing, mammography) that may or may not be recommended:
   a) Inform the patient about limitations of the screening test (i.e., sensitivity and specificity).
   b) Counsel the patient about the implications of proceeding with the test.

4. Keep up to date with new recommendations for the periodic health examination, and critically evaluate their usefulness and application to your practice.
Personality Disorder

1. Clearly establish and maintain limits in dealing with patients with identified personality disorders. For example, set limits for:
   - appointment length.
   - drug prescribing.
   - accessibility.

2. In a patient with a personality disorder, look for medical and psychiatric diagnoses when the patient presents for assessment of new or changed symptoms. (Patients with personality disorders develop medical and psychiatric conditions, too.)

3. Look for and attempt to limit the impact of your personal feelings (e.g., anger, frustration) when dealing with patients with personality disorders (e.g., stay focused, do not ignore the patient’s complaint).

4. In a patient with a personality disorder, limit the use of benzodiazepines but use them judiciously when necessary.

5. When seeing a patient whom others have previously identified as having a personality disorder, evaluate the person yourself because the diagnosis may be wrong and the label has significant repercussions.
Pneumonia

1. In a patient who presents without the classic respiratory signs and symptoms (e.g., deterioration, delirium, abdominal pain), include pneumonia in the differential diagnosis.

2. In a patient with signs and symptoms of pneumonia, do not rule out the diagnosis on the basis of a normal chest X-ray film (e.g., consider dehydration, neutropenia, human immunodeficiency virus [HIV] infection).

3. In a patient with a diagnosis of pneumonia, assess the risks for unusual pathogens (e.g., a history of tuberculosis, exposure to birds, travel, HIV infection, aspiration).

4. In patients with pre-existing medical problems (e.g., asthma, diabetes, congestive heart failure) and a new diagnosis of pneumonia:
   a) Treat both problems concurrently (e.g., with prednisone plus antibiotics).
   b) Adjust the treatment plan for pneumonia, taking into account the concomitant medical problems (e.g., be aware of any drug interactions, such as that between warfarin [Coumadin] and antibiotics).

5. Identify patients, through history-taking, physical examination, and testing, who are at high risk for a complicated course of pneumonia and would benefit from hospitalization, even though clinically they may appear stable.

6. In the patient with pneumonia and early signs of respiratory distress, assess, and reassess periodically, the need for respiratory support (bilevel positive airway pressure, continuous positive airway pressure, intubation) (i.e., look for the need before decompensation occurs).

7. For a patient with a confirmed diagnosis of pneumonia, make rational antibiotic choices (e.g., outpatient + healthy = first-line antibiotics; avoid the routine use of “big guns”).

8. In a patient who is receiving treatment for pneumonia and is not responding:
   a) Revise the diagnosis (e.g., identify other or contributing causes, such as cancer, chronic obstructive pulmonary disease, or bronchospasm), consider atypical pathogens (e.g., Pneumocystis carinii, TB, and diagnose complications (e.g., empyema, pneumothorax).
   b) Modify the therapy appropriately (e.g., change antibiotics).

9. Identify patients (e.g., the elderly, nursing home residents, debilitated patients) who would benefit from immunization or other treatments (e.g., flu vaccine, Pneumovax, ribavarine) to reduce the incidence of pneumonia.

10. In patients with a diagnosis of pneumonia, ensure appropriate follow-up care (e.g., patient education, repeat chest X-ray examination, instructions to return if the condition worsens).

11. In patients with a confirmed diagnosis of pneumonia, arrange contact tracing when appropriate (e.g., in those with TB, nursing home residents, those with legionnaires’ disease).
Poisoning

1. As part of well-child care, discuss preventing and treating poisoning with parents (e.g., "child-proofing", poison control number).

2. In intentional poisonings (overdose) think about multi-toxin ingestion.

3. When assessing a patient with a potentially toxic ingestion, take a careful history about the timing and nature of the ingestion.

4. When assessing a patient with a potential poisoning, do a focused physical examination to look for the signs of toxidromes.

5. When assessing a patient exposed (contact or ingestion) to a substance, clarify the consequences of the exposure (e.g., don’t assume it is non-toxic, call poison control).

6. When managing a toxic ingestion, utilize poison control protocols that are current.

7. When managing a patient with a poisoning,
   a) Assess ABC’s,
   b) Manage ABC’s,
   c) Regularly reassess the patient’s ABC’s (i.e., do not focus on antidotes and decontamination while ignoring the effect of the poisoning on the patient).
Pregnancy

1. In a patient who is considering pregnancy:
   a) Identify risk factors for complications.
   b) Recommend appropriate changes (e.g., folic acid intake, smoking cessation, medication changes).

2. In a female or male patient who is sexually active, who is considering sexual activity, or who has the potential to conceive or engender a pregnancy, use available encounters to educate about fertility.

3. In a patient with suspected or confirmed pregnancy, establish the desirability of the pregnancy.

4. In a patient presenting with a confirmed pregnancy for the first encounter:
   a) Assess maternal risk factors (medical and social).
   b) Establish accurate dates.
   c) Advise the patient about ongoing care.

5. In pregnant patients:
   a) Identify those at high risk (e.g., teens, domestic violence victims, single parents, drug abusers, impoverished women).
   b) Refer these high-risk patients to appropriate resources throughout the antepartum and postpartum periods.

6. In at-risk pregnant patients (e.g., women with human immunodeficiency virus infection, intravenous drug users, and diabetic or epileptic women), modify antenatal care appropriately.

7. In a pregnant patient presenting with features of an antenatal complication (e.g., premature rupture of membranes, hypertension, bleeding):
   a) Establish the diagnosis.
   b) Manage the complication appropriately.

8. In a patient presenting with dystocia (prolonged dilatation, failure of descent):
   a) Diagnose the problem.
   b) Intervene appropriately.

9. In a patient with clinical evidence of complications in labour (e.g., abruption, uterine rupture, shoulder dystocia, non-reassuring fetal monitoring):
   a) Diagnose the complication.
   b) Manage the complication appropriately.

10. In the patient presenting with clinical evidence of a postpartum complication (e.g., delayed or immediate bleeding, infection):
    a) Diagnose the problem (e.g., unrecognized retained placenta, endometritis, cervical laceration).
    b) Manage the problem appropriately.

11. In pregnant or postpartum patients, identify postpartum depression by screening for risk factors, monitoring patients at risk, and distinguishing postpartum depression from the "blues."

12. In a breast-feeding woman, screen for and characterize dysfunctional breast-feeding (e.g., poor latch, poor production, poor letdown).
Prostate

1. Appropriately identify patients requiring prostate cancer screening.

2. In a patient suitable for prostate cancer screening, use and interpret tests (e.g., prostate-specific antigen testing, digital rectal examination [DRE], ultrasonography) in an individualized/sequential manner to identify potential cases.

3. In patients with prostate cancer, actively search out the psychological impact of the diagnosis and treatment modality.

4. In patients with prostate cancer, considering a specific treatment option (e.g., surgery, radiotherapy, chemotherapy, hormonal treatment, no treatment):
   a) Advise about the risks and benefits of treatment.
   b) Monitor patients for complications following treatment.

5. In patients with prostate cancer, actively ask about symptoms of local recurrence or distant spread.

6. Given a suspicion of benign prostatic hypertrophy, diagnose it using appropriate history, physical examination, and investigations.

7. In patients presenting with specific or non-specific urinary symptoms:
   a) Identify the possibility of prostatitis.
   b) Interpret investigations (e.g., urinalysis, urine culture-and-sensitivity testing, Digital Rectal Exam, swab testing, reverse transcription-polymerase chain reaction assay) appropriately.
Rape/Sexual Assault

1. Provide comprehensive care to all patients who have been sexually assaulted, regardless of their decision to proceed with evidence collection or not.

2. Apply the same principles of managing sexual assault in the acute setting to other ambulatory settings (i.e. medical assessment, pregnancy prevention, STI screening/treatment/prophylaxis, counselling).

3. Limit documentation in sexual assault patients to observations and other necessary medical information (i.e., avoid recording hearsay information).

4. In addition to other post-exposure prophylactic measures taken, assess the need for human immunodeficiency virus and hepatitis B prophylaxis in patients who have been sexually assaulted.

5. Offer counselling to all patients affected by sexual assault, whether they are victims, family members, friends, or partners; do not discount the impact of sexual assault on all of these people.

6. Revisit the need for counselling in patients affected by sexual assault.

7. Enquire about undisclosed sexual assault when seeing patients who have symptoms such as depression, anxiety, and somatization.
Red Eye

1. In addressing eye complaints, always assess visual acuity using history, physical examination, or the Snellen chart, as appropriate.

2. In a patient with a red eye, distinguish between serious causes (e.g., keratitis, glaucoma, perforation, temporal arteritis) and non-serious causes (i.e., do not assume all red eyes are caused by conjunctivitis):
   a) Take an appropriate history (e.g., photophobia, changes in vision, history of trauma).
   b) Do a focused physical examination (e.g., pupil size, and visual acuity, slit lamp, fluorescein).
   c) Do appropriate investigations (e.g., erythrocyte sedimentation rate measurement, tonometry).
   d) Refer the patient appropriately (if unsure of the diagnosis or if further work-up is needed).

3. In patients presenting with an ocular foreign body sensation, correctly diagnose an intraocular foreign body by clarifying the mechanism of injury (e.g., high speed, metal on metal, no glasses) and investigating (e.g., with computed tomography, X-ray examination) when necessary.

4. In patients presenting with an ocular foreign body sensation, evert the eyelids to rule out the presence of a conjunctival foreign body.

5. In neonates with conjunctivitis (not just blocked lacrimal glands or “gunky” eyes), look for a systemic cause and treat it appropriately (i.e., with antibiotics).

6. In patients with conjunctivitis, distinguish by history and physical examination between allergic and infectious causes (viral or bacterial).

7. In patients who have bacterial conjunctivitis and use contact lenses, provide treatment with antibiotics that cover for *Pseudomonas*.

8. Use steroid treatment only when indicated (e.g., to treat iritis; avoid with keratitis and conjunctivitis).

9. In patients with iritis, consider and look for underlying systemic causes (e.g., Crohn’s disease, lupus, ankylosing spondylitis).
Schizophrenia

1 In adolescents presenting with problem behaviours, consider schizophrenia in the differential diagnosis.

2 In “apparently” stable patients with schizophrenia (e.g., those who are not floridly psychotic), provide regular or periodic assessment in a structured fashion e.g.- positive and negative symptoms, the performance of activities of daily living, and the level of social functioning at each visit; seeking collateral information from family members and other caregivers to develop a more complete assessment of symptoms and functional status; competency to accept or refuse treatment, and document specifically; suicidal and homicidal ideation, as well as the risk for violence; medication compliance and side effects

3 In all patients presenting with psychotic symptoms, inquire about substance use and abuse.

4 Consider the possibility of substance abuse and look for it in patients with schizophrenia, as this is a population at risk.

5 In patients with schizophrenia, assess and treat substance abuse appropriately.

6 In decompensating patients with schizophrenia, determine: if substance abuse is contributory. the role of medication compliance and side-effect problems. if psychosocial supports have changed.

7 Diagnose and treat serious complications/side effects of antipsychotic medications (e.g., neuroleptic malignant syndrome, tardive dyskinesia).

8 Include psychosocial supports (e.g., housing, family support, disability issues, vocational rehabilitation) as part of the treatment plan for patients with schizophrenia.
Seizures

1 In a patient having a seizure:
   a) Ensure proper airway control (e.g., oropharyngeal airway or nasal trumpet, lateral decubitus
to prevent aspiration).
   b) Use drugs (e.g., benzodiazepines, phenytoin) promptly to stop the seizure, even before the
   etiology is confirmed.
   c) Rule out reversible metabolic causes in a timely fashion (e.g., hypoglycemia, hypoxia, heat
   stroke, electrolytes abnormalities).

2 In a patient presenting with an ill-defined episode (e.g., fits, spells, turns), take a history to
distinguish a seizure from other events.

3 In a patient presenting with a seizure, take an appropriate history to direct the investigation
(e.g., do not overinvestigate; a stable known disorder may require only a drug-level
measurement, while new or changing seizures may require an extensive work-up).

4 In all patients presenting with a seizure, examine carefully for focal neurologic findings.

5 In a patient with a previously known seizure disorder, who presents with a seizure or a change
in the pattern of seizures:
   a) Assess by history the factors that may affect the primary seizure disorder (e.g., medication
   compliance, alcohol use, lifestyle, recent changes in medications [not just antiepileptic
   medications], other illnesses).
   b) Include other causes of seizure in the differential diagnosis. (Not all seizures are caused by
   epilepsy.)

6 In the ongoing care of a patient with a stable seizure disorder:
   a) Regularly inquire about compliance (with medication and lifestyle measures), side effects of
   anticonvulsant medication, and the impact of the disorder and its treatment on the patient’s
   life (e.g., on driving, when seizures occur at work or with friends).
   b) Monitor for complications of the anticonvulsant medication (e.g., hematologic complications,
   osteoporosis).
   c) Modify management of other health issues taking into account the anticonvulsant
   medication (e.g., in prescribing antibiotics, pregnancy).
Sex

1. In patients, specifically pregnant women, adolescents, and perimenopausal women:
   a) Inquire about sexuality (e.g., normal sexuality, safe sex, contraception, sexual orientation, and sexual dysfunction).
   b) Counsel the patient on sexuality (e.g., normal sexuality, safe sex, contraception, sexual orientation, and sexual dysfunction).

2. Screen high-risk patients (e.g., post-myocardial infarction patients, diabetic patients, patients with chronic disease) for sexual dysfunction, and screen other patients when appropriate (e.g., during the periodic health examination).

3. In patients presenting with sexual dysfunction, identify features that suggest organic and non-organic causes.

4. In patients who have sexual dysfunction with an identified probable cause, manage the dysfunction appropriately.

5. In patients with identified sexual dysfunction, inquire about partner relationship issues.
In a patient who is sexually active or considering sexual activity, take advantage of opportunities to advise her or him about prevention, screening, and complications of sexually transmitted infections (STIs).

In a patient with symptoms that are atypical or non-specific for STIs (e.g., dysuria, recurrent vaginal infections):
   a) Consider STIs in the differential diagnosis.
   b) Investigate appropriately.

In high-risk patients who are asymptomatic for STIs, screen and advise them about preventive measures.

In high-risk patients who are symptomatic for STIs, provide treatment before confirmation by laboratory results.

In a patient requesting STI testing:
   a) Identify the reason(s) for requesting testing.
   b) Assess the patient’s risk.
   c) Provide counselling appropriate to the risk (i.e., human immunodeficiency virus [HIV] infection risk, non-HIV risk).

In a patient with a confirmed STI, initiate:
   - treatment of partner(s).
   - contact tracing through a public health or community agency.

Use appropriate techniques for collecting specimens.

Given a clinical scenario that is strongly suspicious for an STI and a negative test result, do not exclude the diagnosis of an STI (i.e., because of sensitivity and specificity problems or other test limitations).
Skin Disorder

1. In dealing with a persistent skin problem that is not responding to treatment as expected:
   a) Reconsider the diagnosis (e.g., "eczema" may really be a fungal infection).
   b) Investigate or modify treatment (e.g., for acne).

2. In a patient presenting with a skin lesion, distinguish benign from serious pathology (e.g., melanoma, pemphigus, cutaneous T-cell lymphoma) by physical examination and appropriate investigations (e.g., biopsy or excision).

3. In a patient presenting with a cutaneous manifestation of a systemic disease or condition (e.g., Wegener's granulomatosis, lupus, a drug reaction), consider the diagnosis of systemic disease and confirm it through history, physical examination, and appropriate investigations.

4. When prompted by a patient with a concern about a localized skin lesion or when screening for mucocutaneous lesions, inspect all areas of the skin (e.g., nails, scalp, oral cavity, perineum, soles of the feet, back of the neck).

5. Diagnose and promptly treat suspected life-threatening dermatologic emergencies (e.g., Stevens-Johnson syndrome, invasive cellulitis, chemical or non-chemical burns).

6. In high-risk patients (diabetics, bed or chair bound, peripheral vascular disease):
   a) Examine the skin even when no specific skin complaint is present.
   b) Treat apparently minor skin lesions aggressively.

7. In a patient being treated for a new or persistent skin condition (e.g., acne, psoriasis), determine the impact on the patient's personal and social life.
Smoking Cessation

1 In all patients, regularly evaluate and document smoking status, recognizing that people may stop or start at any time.

2 In smokers:
   a) Discuss the benefits of quitting or reducing smoking.
   b) Regularly assess interest in quitting or reducing smoking.

3 In smokers motivated to quit, advise the use of a multi-strategy approach to smoking cessation.
**Somatization**

1. In patients with recurrent physical symptoms, diagnose somatization only after an adequate work-up to rule out any medical or psychiatric condition (e.g., depression).

2. Do not assume that somatization is the cause of new or ongoing symptoms in patients previously diagnosed as somatizers. Periodically reassess the need to extend/repeat the work-up in these patients.

3. Acknowledge the illness experience of patients who somatize, and strive to find common ground with them concerning their diagnosis and management, including investigations. This is usually a long-term project, and should be planned as such.

4. In patients who somatize, inquire about the use of and suggest therapies that may provide symptomatic relief, and/or help them cope with their symptoms (e.g., with biofeedback, acupuncture, or naturopathy).
Stress

1. In a patient presenting with a symptom that could be attributed to stress (e.g., headache, fatigue, pain) consider and ask about stress as a cause or contributing factor.

2. In a patient in whom stress is identified, assess the impact of the stress on their function (i.e., coping vs. not coping, stress vs. distress).

3. In patients not coping with stress, look for and diagnose, if present, mental illness (e.g., depression, anxiety disorder).

4. In patients not coping with the stress in their lives,
   a) Clarify and acknowledge the factors contributing to the stress,
   b) Explore their resources and possible solutions for improving the situation.

5. In patients experiencing stress, look for inappropriate coping mechanisms (e.g., drugs, alcohol, eating, violence).
Stroke

1. In patients presenting with symptoms and/or signs suggestive of stroke, include other diagnoses in the differential diagnosis (e.g., transient ischemic attack [TIA], brain tumour, hypoglycemia, subdural hematoma, subarachnoid bleed).

2. In a patient presenting with a stroke, differentiate, if possible, hemorrhagic from embolic/thrombotic stroke (e.g., through the history, physical examination, and ancillary testing, such as scanning and electrocardiography), as treatment differs.

3. Assess patients presenting with neurologic deficits in a timely fashion, to determine their eligibility for thrombolysis.

4. In a patient diagnosed with stroke, involve other professionals as needed (e.g., a physical therapist, an occupational therapist, social service personnel, a physiatrist, a neurologist) to ensure the best outcome for the patient.

5. When caring for a stroke patient with severe/serious deficits, involve the patient and her or his family in decisions about intervention (e.g., resuscitation, use of a feeding tube, treatment of pneumonia).

6. In patients who have suffered stroke, diagnose “silent” cognitive deficits (not associated with sensory or motor symptoms or signs, such as inattention and impulsivity) when they are present.

7. Provide realistic prognostic advice about their disabilities to stroke patients and their families.

8. In stroke patients with disabilities, evaluate the resources and supports needed to improve function (e.g., a cane, a walker, home care).

9. In the continuing care of stroke patients with deficits (e.g., dysphagia, being bedridden), include the prevention of certain complications (e.g., aspiration pneumonia, decubitus ulcer) in the treatment plan, as they are more common.

10. In patients at risk of stroke, treat modifiable risk factors (e.g., atrial fibrillation, diabetes, hyperlipidemia, and hypertension).

11. In all patients with a history of TIA or completed stroke, and in asymptomatic patients at high risk for stroke, offer antithrombotic treatment (e.g., acetylsalicylic acid, clopidogrel) to appropriate patients to lower stroke risk.
1 In all patients, and especially in high-risk groups (e.g., mental illness, chronic disability), opportunistically screen for substance use and abuse (tobacco, alcohol, illicit drugs).

2 In intravenous drug users:
   a) Screen for blood-borne illnesses (e.g., human immunodeficiency virus infection, hepatitis).
   b) Offer relevant vaccinations.

3 In patients with signs and symptoms of withdrawal or acute intoxication, diagnose and manage it appropriately.

4 Discuss substance use or abuse with adolescents and their caregivers when warning signs are present (e.g., school failure, behaviour change).

5 Consider and look for substance use or abuse as a possible factor in problems not responding to appropriate intervention (e.g., alcohol abuse in patients with hypertriglyceridemia, inhalational drug abuse in asthmatic patients).

6 Offer support to patients and family members affected by substance abuse. (The abuser may not be your patient.)

7 In patients abusing substances, determine whether or not they are willing to agree with the diagnosis.

8 In substance users or abusers, routinely determine willingness to stop or decrease use.

9 In patients who abuse substances, take advantage of opportunities to screen for co-morbidities (e.g., poverty, crime, sexually transmitted infections, mental illness) and long-term complications (e.g., cirrhosis).
Suicide

1. In any patient with mental illness (i.e., not only in depressed patients), actively inquire about suicidal ideation (e.g., ideas, thoughts, a specific plan).

2. Given a suicidal patient, assess the degree of risk (e.g., thoughts, specific plans, access to means) in order to determine an appropriate intervention and follow-up plan (e.g., immediate hospitalization, including involuntary admission; outpatient follow-up; referral for counselling).

3. Manage low-risk patients as outpatients, but provide specific instructions for follow-up if suicidal ideation progresses/worsens (e.g., return to the emergency department [ED], call a crisis hotline, re-book an appointment).

4. In suicidal patients presenting at the emergency department with a suspected drug overdose, always screen for acetylsalicylic acid and acetaminophen overdoses, as these are common, dangerous, and frequently overlooked.

5. In trauma patients, consider attempted suicide as the precipitating cause.
Thyroid

1  Limit testing for thyroid disease to appropriate patients, namely those with a significant pre-test probability of abnormal results, such as:
   - those with classic signs or symptoms of thyroid disease.
   - those whose symptoms or signs are not classic, but who are at a higher risk for disease (e.g., the elderly, postpartum women, those with a history of atrial fibrillation, those with other endocrine disorders).

2  In patients with established thyroid disease, do not check thyroid-stimulating hormone levels too often, but rather test at the appropriate times, such as:
   - after changing medication doses.
   - when following patients with mild disease before initiating treatment.
   - periodically in stable patients receiving treatment.

3  When examining the thyroid gland, use proper technique (i.e., from behind the patient, ask the patient to swallow), especially to find nodules (which may require further investigation).

Note: The investigation of thyroid nodules is not covered here.
1 Assess and stabilize trauma patients with an organized approach, anticipating complications in a timely fashion, using the primary and secondary surveys.

2 Suspect, identify, and immediately begin treating life-threatening complications (e.g., tension pneumothorax, tamponade).

3 When faced with several trauma patients, triage according to resources and treatment priorities.

4 In trauma patients, secure the airway appropriately (e.g., assume cervical spine injury, use conscious sedation, recognize a difficult airway, plan for back-up methods/cricothyrotomy).

5 In a patient with signs and symptoms of shock:
   a) Recognize the shock.
   b) Define the severity and type (neurogenic, hypovolemic, septic).
   c) Treat the shock.

6 In trauma patients, rule out hypothermia on arrival and subsequently (as it may develop during treatment).

7 Suspect certain medical problems (e.g., seizure, drug intoxication, hypoglycemia, attempted suicide) as the precipitant of the trauma.

8 Do not move potentially unstable patients from treatment areas for investigations (e.g., computed tomography, X-ray examination).

9 Determine when patient transfer is necessary (e.g., central nervous system bleeds, when no specialty support is available).

10 Transfer patients in an appropriate manner (i.e., stabilize them before transfer and choose the method, such as ambulance or flight).

11 Find opportunities to offer advice to prevent or minimize trauma (e.g., do not drive drunk, use seatbelts and helmets).

12 In children with traumatic injury, rule out abuse. (Carefully assess the reported mechanism of injury to ensure it corresponds with the actual injury.)
Travel Medicine

1. Make sure travelers get up to date, timely, itinerary-specific advice from a reliable source (e.g., travel clinic, travel website).

2. When seeing patients planning travel, discuss the common, non-infectious perils of travel (e.g., accidents, safer sex, alcohol, safe travel for women).

3. In patients presenting with symptoms of infection without an obvious cause, especially those with a fever, enquire about recent travel history to identify potential sources (especially, but not exclusively, malaria).

4. Provide prevention and treatment advice and prescribe medications for common conditions associated with travel (e.g., traveler’s diarrhea, altitude sickness).

5. Ensure patients understand how to manage their chronic disease while traveling (e.g., diabetes, asthma, international normalized ratios [INRs]).

6. Use patient visits for travel advice as an opportunity to update routine vaccinations.

7. Advise patients to check insurance coverage issues especially in regard to recent changes in chronic disease and any recent treatment changes.

8. Advise patients traveling with medications to have an adequate supply, documentation of need for use, and to transport them securely (e.g., carry-on bag).
Upper Respiratory Tract Infection

1 Given an appropriate history and/or physical examination:
   a) Differentiate life-threatening conditions (epiglottitis, retropharyngeal abscess) from benign conditions.
   b) Manage the condition appropriately.

2 Make the diagnosis of bacterial sinusitis by taking an adequate history and performing an appropriate physical examination, and prescribe appropriate antibiotics for the appropriate duration of therapy.

3 In a patient presenting with upper respiratory symptoms:
   a) Differentiate viral from bacterial infection (through history and physical examination).
   b) Diagnose a viral upper respiratory tract infection (URTI) (through the history and a physical examination).
   c) Manage the condition appropriately (e.g., do not give antibiotics without a clear indication for their use).

4 Given a history compatible with otitis media, differentiate it from otitis externa and mastoiditis, according to the characteristic physical findings.

5 In high-risk patients (e.g., those who have human immunodeficiency virus infection, chronic obstructive pulmonary disease, or cancer) with upper respiratory infections: look for complications more aggressively and follow up more closely.

6 In a presentation of pharyngitis, look for mononucleosis.

7 In high-risk groups:
   a) Take preventive measures (e.g., use flu and pneumococcal vaccines).
   b) Treat early to decrease individual and population impact (e.g., with oseltamivir phosphate [Tamiflu], amantadine).
Urinary Tract Infection

1. Take an appropriate history and do the required testing to exclude serious complications of urinary tract infection (UTI) (e.g., sepsis, pyelonephritis, impacted infected stones).

2. Appropriately investigate all boys with urinary tract infections, and young girls with recurrences (e.g., ultrasound).

3. In diagnosing urinary tract infections, search for and/or recognize high-risk factors on history (e.g., pregnancy; immune compromise, neonate, a young male, or an elderly male with prostatic hypertrophy).

4. In a patient with a diagnosed urinary tract infection, modify the choice and duration of treatment according to risk factors (e.g., pregnancy, immunocompromise, male extremes of age); and treat before confirmation of culture results in some cases (e.g., pregnancy, sepsis, pyelonephritis).

5. Given a non-specific history (e.g., abdominal pain, fever, delirium) in elderly or very young patients, suspect the diagnosis and do an appropriate work-up.

6. In a patient with dysuria, exclude other causes (e.g., sexually transmitted infections, vaginitis, stones, interstitial cystitis, prostatitis) through an appropriate history, physical examination, and investigation before diagnosing a urinary tract infection.
Vaginal Bleeding

1 In any woman with vaginal bleeding, rule out pregnancy.

2 In pregnant patients with vaginal bleeding
   a) Consider worrisome causes (e.g., ectopic pregnancy, abruption, abortion), and confirm or exclude the diagnosis through appropriate interpretation of test results.
   b) Do not forget blood typing and screening, and offer rH immunoglobulin treatment, if appropriate.
   c) Diagnose (and treat) hemodynamic instability.

3 In a non-pregnant patient with vaginal bleeding:
   a) Do an appropriate work-up and testing to diagnose worrisome causes (e.g., cancer), using an age-appropriate approach.
   b) Diagnose (and treat) hemodynamic instability.
   c) Manage hemodynamically stable but significant vaginal bleeding (e.g., with medical versus surgical treatment).

4 In a post-menopausal woman with vaginal bleeding, investigate any new or changed vaginal bleeding in a timely manner (e.g., with endometrial biopsy testing, ultrasonography, computed tomography, a Pap test, and with a pelvic examination).
Vaginitis

1. In patients with recurrent symptoms of vaginal discharge and/or perineal itching, have a broad differential diagnosis (e.g., lichen sclerosus et atrophicus, vulvar cancer, contact dermatitis, colovaginal fistula), take a detailed history, and perform a careful physical examination to ensure appropriate investigation or treatment. (Do not assume that the symptoms indicate just a yeast infection.)

2. In patients with recurrent vaginal discharge, no worrisome features on history or physical examination, and negative tests, make a positive diagnosis of physiologic discharge and communicate it to the patient to avoid recurrent consultation, inappropriate treatment, and investigation in the future.

3. When bacterial vaginosis and candidal infections are identified through routine vaginal swab or Pap testing, ask about symptoms and provide treatment only when it is appropriate.

4. In a child with a vaginal discharge, rule out sexually transmitted infections and foreign bodies. (Do not assume that the child has a yeast infection.)

5. In a child with a candidal infection, look for underlying illness (e.g., immunocompromise, diabetes).
## Violent/Aggressive Patient

1. In certain patient populations (e.g., intoxicated patients, psychiatric patients, patients with a history of violent behaviour):
   a) Anticipate possible violent or aggressive behaviour.
   b) Recognize warning signs of violent/aggressive behaviour.
   c) Have a plan of action before assessing the patient (e.g., stay near the door, be accompanied by security or other personnel, prepare physical and/or chemical restraints if necessary).

2. In all violent or aggressive patients, including those who are intoxicated, rule out underlying medical or psychiatric conditions (e.g., hypoxemia, neurologic disorder, schizophrenia) in a timely fashion (i.e., don’t wait for them to sober up, and realize that their calming down with or without sedation does not necessarily mean they are better).

3. In a violent or aggressive patient, ensure the safety (including appropriate restraints) of the patient and staff before assessing the patient.

4. In managing your practice environment (e.g., office, emergency department), draw up a plan to deal with patients who are verbally or physically aggressive, and ensure your staff is aware of this plan and able to apply it.
Well-baby Care

1. Measure and chart growth parameters, including head circumference, at each assessment; examine appropriate systems at appropriate ages, with the use of an evidence-based pediatric flow sheet such as the Rourke Baby Record.

2. Modify the routine immunization schedule in those patients who require it (e.g., those who are immunocompromised, those who have allergies).

3. Anticipate and advise on breast-feeding issues (e.g., weaning, returning to work, sleep patterns) beyond the newborn period to promote breast-feeding for as long as it is desired.

4. At each assessment, provide parents with anticipatory advice on pertinent issues (e.g., feeding patterns, development, immunization, parenting tips, antipyretic dosing, safety issues).

5. Ask about family adjustment to the child (e.g., sibling interaction, changing roles of both parents, involvement of extended family).

6. With parents reluctant to vaccinate their children, address the following issues so that they can make an informed decision:
   - their understanding of vaccinations.
   - the consequences of not vaccinating (e.g., congenital rubella, death).
   - the safety of unvaccinated children (e.g., no Third World travel).

7. When recent innovations (e.g., new vaccines) and recommendations (e.g., infant feeding, circumcision) have conflicting, or lack defined, guidelines, discuss this information with parents in an unbiased way to help them arrive at an informed decision.

8. Even when children are growing and developing appropriately, evaluate their nutritional intake (e.g., type, quality, and quantity of foods) to prevent future problems (e.g., anemia, tooth decay), especially in at-risk populations (e.g., the socioeconomically disadvantaged, those with voluntarily restricted diets, those with cultural variations).
